

## **Ask A Genius 8 - Science Fiction as Science Fact 2**

**Scott Douglas Jacobsen and Rick Rosner**

**What about other things that are science fiction becoming science fact? What about intimate technology with respect to our bodies?**

We're going to have add-ons. Things that ride inside of us. Things that ride alongside us. Brain augmentation will be a thing. Generally, those things work with people getting stuff. Technology to ameliorate or alleviate illnesses. We already have brain pacemakers for Parkinson's people.

You have hearing aids for the hearing impaired. You have bad, but existent, visual field helpers for blind people. There will be more add-ons. Eventually, the technology will become powerful and flexible enough that regular people that want to have added mental tools will start using add-ons or built-ins.

We'll have brain replacement, built-ins, and add-ons for people suffering from Alzheimer's. People will take the additional brain processing bio-elements to become part of the brain that will still be able to do some of your thinking, when much of your brain is compromised by the diseases of old age.

At the time, those add-ons will be further adapted for people not suffering from diseases. People will acquire improved abilities that we already have and abilities that we don't have.
